L2 ANSWER 1 OF 1 BIOSIS COPYRIGHT 2003 BIOLOGICAL ABSTRACTS INC.
TI DIFFERENTIAL PROTEOLYTIC ACTIVATION OF FACTOR VIII-VON
WILLEBRAND FACTOR COMPLEX BY THROMBIN.
AB Blood coagulation factor VIII (fVIII) is a plasma protein that is decreased or absent in hemophilia A. It is isolated as a mixture of heterodimers that contain a variably sized heavy chain and a common light chain. Thrombin catalyzes the activation of fVIII in a reaction that is associated with cleavages in both types of chain. We isolated a serine protease from Bothrops jararacussu snake venom that catalyzes thrombin-like heavy-chain cleavage but not light-chain cleavage in porcine

fVIII as judged by NaDODSO4/PAGE and N-terminal sequence analysis. Using a plasma-free assay of the ability of activated fVIII to function as a cofactor in the activation of factor X by factor IXa, we found that fVIII is activated by the venom enzyme. The venom enzyme-activated fVIII was isolated in stable form by cation-exchange HPLC.

von Willebrand factor inhibited venom enzyme-activated fVIII but not thrombin-activated fVIII. These results suggest that the binding of fVIII to **von Willebrand factor** depends on the presence of an intact light chain and that activated fVIII must dissociate from **von Willebrand factor** to exert its cofactor effect. Thus, proteolytic activation of fVIII-**von Willebrand factor** complex appears to be differentially regulated by light-chain cleavage to dissociate the **complex** and heavy-chain cleavage to activate the cofactor function.
